

PYTHON-WEB-SRC-//-KAGGLE

// This is the Web-SRC-Python Script used in some web-hosted platforms, not generally necessary for all organizations. Knowing to do this is definitely what all Python/Analyst and Scientist all-to-know//. // It's primarily for inferential purpose. //

```
from bs4 import BeautifulSoup
import requests
```

```
url =
'https://en.wikipedia.org/wiki/List_of_largest_companies_in_the_United_States_by_revenue'
headers = {
    'User-Agent': 'Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/120.0.0.0 Safari/537.36'
}
page = requests.get(url, headers=headers)
soup = BeautifulSoup(page.text, 'html.parser')
```

```
print(soup)
```

```
soup.find_all('table')[0]
```

```
table = soup.find_all('table')[0]
```

```
table.find_all('th')
```

```
world_titles = table.find_all('th')
```

```
world_table_titles = [title.text.strip() for title in world_titles]
print(world_table_titles)
```

Importing into MySQL Database

```
import pandas as pd
```

```
df = pd.DataFrame(columns = world_table_titles)
df
```

```

column_data = table.find_all('tr')
for row in column_data[1:]:
    row_data = row.find_all('td')
    individual_row_data = [data.text.strip() for data in row_data]

length = len(df)
df.loc[length] = individual_row_data

df

from sqlalchemy import create_engine

df.rename(columns={'Revenue (USD millions)': 'Revenue(USD millions)'}, inplace=True)

user = "root"
password = "Urgently123#?God"
host = "localhost"
database = "big_profiting_companies"

engine = create_engine(f"mysql+mysqlconnector://{user}:{password}@{host}/{database}")
df.to_sql('companies_profit', engine, if_exists='replace', index=False)

print("Datatransfer complete.").

# I used Profiting Companies by Revenue in the USA as an illustration.#.

```
